

Power Glass®

High Tech laminated glass with integrated light-emitting diodes

With the development of Power Glass®, it has been successful for the first time to combine chip-LED's, with double-sided emitted lighting on completely transparent conductive track structures, inside laminated glass with a wireless supply of electric energy.

Light spots seem to float within the glass with no visible form of support.

The inserted light-emitting diodes can build light circles, squares, lines or even readable running writing in combination with a PC.
